Page 3 questions

1. Identify if the following triangles are right angled or not.

Triangles **a**, **c**, **d**, **e** are right angled indicated by the small square in the corner of each triangle.

2. What is the sum of the interior angles of a triangle?

The sum of the interior angles of a triangle is 180° .

3. Identify if the following triangles are right angled.

Sum of the interior angles is 180° . The last angle must be 90° for the triangle to be right angled.

Therefore,

$$180^\circ - 40^\circ - 50^\circ = 90^\circ$$

Therefore, the triangle is right angled since the last angle is 90°

Sum of the interior angles is 180° . The last angle must be 90° for the triangle to be right angled.

Therefore,

$$180^\circ - 30^\circ - 50^\circ = 100^\circ$$

Therefore, the triangle is not right angled since the last angle is 100° .

Sum of the interior angles is 180° . The last angle must be 90° for the triangle to be right angled.

Therefore,

$$180^\circ - 42^\circ - 48^\circ = 90^\circ$$

Therefore, the triangle is right angled since the last angle is 90°

Page 4 questions

4. Label the opposite, adjacent and hypotenuse in each of the following triangles.

5. Use the following 5 triangles to fill in the correct sides in the table below:

Triangle	Opposite to θ	Adjacent to θ	Opposite to α	Adjacent to α	Hypotenuse
$\triangle ABC$	AC	BC	BC	AC	AB
$\triangle DEF$	EF	DE	DE	EF	DF
$\triangle LMN$	MN	LM	ML	MN	LN
$\triangle PQR$	PR	QR	QR	PR	PQ
$\triangle WXY$	WX	WY	WY	WX	XY

Page 9 questions

1. Use the triangles to complete the table below:

Triangle	Opposite to θ	Adjacent to θ	Hypotenuse	$\sin\theta$	$\cos\theta$	$\tan\theta$
1	18	24	30	$\frac{18}{30} = \frac{3}{5}$	$\frac{24}{30} = \frac{4}{5}$	$\frac{18}{24} = \frac{3}{4}$
2	5	2	$\sqrt{29}$	$\frac{5}{\sqrt{29}}$	$\frac{2}{\sqrt{29}}$	$\frac{5}{2}$
3	$\sqrt{51}$	7	10	$\frac{\sqrt{51}}{10}$	$\frac{7}{10}$	$\frac{\sqrt{51}}{7}$
4	10	24	26	$\frac{10}{26} = \frac{5}{13}$	$\frac{24}{26} = \frac{12}{13}$	$\frac{10}{24} = \frac{5}{12}$
5	$\sqrt{32}$	2	6	$\frac{\sqrt{32}}{6}$	$\frac{2}{6} = \frac{1}{3}$	$\frac{\sqrt{32}}{2}$

Page 9 questions

2. Complete the following for each triangle:

$$\begin{aligned} \sin \angle A &= \frac{O}{H} \\ &= \frac{24}{30} \\ &= \frac{4}{5} \end{aligned}$$

$$\begin{aligned} \cos \angle B &= \frac{A}{H} \\ &= \frac{24}{30} \\ &= \frac{4}{5} \end{aligned}$$

$$\begin{aligned} \tan \angle B &= \frac{O}{A} \\ &= \frac{18}{24} \\ &= \frac{3}{4} \end{aligned}$$

$$\begin{aligned} \cos \angle E &= \frac{A}{H} \\ &= \frac{11}{\sqrt{221}} \end{aligned}$$

$$\begin{aligned} \tan \angle D &= \frac{O}{A} \\ &= \frac{11}{10} \end{aligned}$$

$$\begin{aligned} \sin \angle D &= \frac{O}{H} \\ &= \frac{11}{\sqrt{221}} \end{aligned}$$

$$\begin{aligned} \tan \angle N &= \frac{O}{A} \\ &= \frac{3}{6} \\ &= \frac{1}{2} \end{aligned}$$

$$\begin{aligned} \sin \angle N &= \frac{O}{H} \\ &= \frac{3}{\sqrt{45}} \end{aligned}$$

$$\begin{aligned} \cos \angle N &= \frac{A}{H} \\ &= \frac{6}{\sqrt{45}} \end{aligned}$$

Page 10 questions

3. Find the missing side in each right angled triangle, and then find the ratios that follow:

Find MN , use Pythagoras $MN^2 = MP^2 + PN^2$ if $MP = 6$, $PN = 8$

$$MN^2 = 6^2 + 8^2$$

$$MN^2 = 36 + 64$$

$$MN^2 = 100$$

$$MN = \pm\sqrt{100}$$

$$MN = \pm 10$$

$$MN = 10 \text{ (since length is positive)}$$

$$\begin{aligned} \sin \angle N &= \frac{O}{H} \\ &= \frac{6}{10} \\ &= \frac{3}{5} \end{aligned}$$

$$\begin{aligned} \tan \angle M &= \frac{O}{A} \\ &= \frac{8}{6} \\ &= \frac{4}{3} \end{aligned}$$

$$\begin{aligned} \cos \angle M &= \frac{A}{H} \\ &= \frac{6}{10} \\ &= \frac{3}{5} \end{aligned}$$

$$\begin{aligned} \tan \angle N &= \frac{O}{A} \\ &= \frac{6}{8} \\ &= \frac{3}{4} \end{aligned}$$

Page 10 questions

b

Find the missing side, use Pythagoras $c^2 = a^2 + b^2$ if $a = 12$, $c = 13$

$$13^2 = 12^2 + b^2$$

$$169 = 144 + b^2$$

$$b^2 = 169 - 144$$

$$b^2 = 25$$

$$b = \pm\sqrt{25}$$

$$b = \pm 5$$

$$b = 5$$

$$\sin \theta = \frac{O}{H} = \frac{12}{13}$$

$$\tan \alpha = \frac{O}{A} = \frac{5}{12}$$

$$\sin \alpha = \frac{O}{H} = \frac{5}{13}$$

$$\cos \theta = \frac{A}{H} = \frac{5}{13}$$

c

Find PQ , use Pythagoras $QR^2 = PR^2 + PQ^2$ if $PR = 8$, $QR = 17$

$$17^2 = 8^2 + PQ^2$$

$$289 = 64 + PQ^2$$

$$PQ^2 = 289 - 64$$

$$PQ^2 = 225$$

$$PQ = \pm\sqrt{225}$$

$$PQ = \pm 15$$

$$PQ = 15$$

$$\sin \angle Q = \frac{O}{H} = \frac{8}{17}$$

$$\cos \angle Q = \frac{A}{H} = \frac{15}{17}$$

$$\cos \angle R = \frac{A}{H} = \frac{8}{17}$$

$$\tan \angle R = \frac{O}{A} = \frac{15}{8}$$

d

Find Hypothenuse, use Pythagoras $c^2 = a^2 + b^2$ if $a = 5$, $b = 9$

$$c^2 = 5^2 + 9^2$$

$$c^2 = 25 + 81$$

$$c^2 = 106$$

$$c = \pm\sqrt{106}$$

$$c = \sqrt{106}$$

$$\tan \theta = \frac{O}{A} = \frac{5}{9}$$

$$\cos \alpha = \frac{A}{H} = \frac{5}{\sqrt{106}}$$

$$\sin \theta = \frac{O}{H} = \frac{5}{\sqrt{106}}$$

$$\tan \alpha = \frac{O}{A} = \frac{9}{5}$$

Page 11 questions

4. Evaluate the following, to 3 decimal places:

a $\sin 40^\circ = 0.643$ (3 d.p.)

b $\cos 30^\circ = 0.866$ (3 d.p.)

c $\cos 60^\circ = 0.5$

d $\tan 20^\circ = 0.364$ (3 d.p.)

e $\tan 50^\circ = 1.192$ (3 d.p.)

f $\sin 85^\circ = 0.996$ (3 d.p.)

g $3 \cos 45^\circ = 2.121$ (3 d.p.)

h $\sqrt{2} \sin 45^\circ = 1$

i $\sqrt{3} \tan 30^\circ = 1$

j $4 \sin 73^\circ = 3.825$ (3 d.p.)

k $\frac{\cos 23^\circ}{2} = 0.460$ (3 d.p.)

l $\frac{3 \tan 80^\circ}{4} = 4.253$ (3 d.p.)

5. Find the value of θ (to the nearest degree) if:

a $\cos \theta = 0.5$

$\theta = \cos^{-1}(0.5)$

$\theta = 60^\circ$

b $\sin \theta = 0.25$

$\theta = \sin^{-1}(0.25)$

$\theta = 14^\circ$ (nearest degree)

c $\tan \theta = \sqrt{3}$

$\theta = \tan^{-1}(\sqrt{3})$

$\theta = 60^\circ$

d $\tan \theta = 4.5$

$\theta = \tan^{-1}(4.5)$

$\theta = 77^\circ$ (nearest degree)

e $\cos \theta = 0.81$

$\theta = \cos^{-1}(0.81)$

$\theta = 36^\circ$ (nearest degree)

f $\sin \theta = \frac{\sqrt{2}}{2}$

$\theta = \sin^{-1}\left(\frac{\sqrt{2}}{2}\right)$

$\theta = 45^\circ$

g $\cos \theta = \frac{\sqrt{3}}{2}$

$\theta = \cos^{-1}\left(\frac{\sqrt{3}}{2}\right)$

$\theta = 30^\circ$

h $\tan\left(\frac{\theta}{2}\right) = 3.1$

$\left(\frac{\theta}{2}\right) = \tan^{-1}(3.1)$

$\frac{\theta}{2} = 72^\circ$

$\theta = 144^\circ$ (nearest degree)

i $\sin(2\theta) = 1$

$2\theta = \sin^{-1}(1)$

$2\theta = 90^\circ$

$\theta = 45^\circ$

Page 15 questions

1. Find θ in each triangle to the nearest degree:

$$\cos \theta = \frac{A}{H}$$

$$\cos \theta = \frac{8}{21}$$

$$\theta = \cos^{-1}\left(\frac{8}{21}\right)$$

$$\theta = 68^\circ$$

$$\sin \theta = \frac{O}{H}$$

$$\sin \theta = \frac{11}{14}$$

$$\theta = \sin^{-1}\left(\frac{11}{14}\right)$$

$$\theta = 52^\circ$$

$$\tan \theta = \frac{O}{A}$$

$$\tan \theta = \frac{12}{13.5}$$

$$\theta = \tan^{-1}\left(\frac{12}{13.5}\right)$$

$$\theta = 42^\circ$$

2. Complete the table below if you are solving side labeled x :

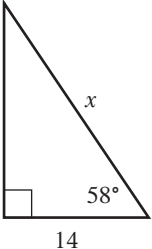

Triangle	Given side for angle	Missing side for angle (x)	Correct ratio to use (sin, cos, tan)
a	Adjacent	Hypotenuse	cos
b	Adjacent	Opposite	tan
c	Hypotenuse	Opposite	sin
d	Adjacent	Hypotenuse	cos

Page 16 questions

3. Find the value of x in each of the triangles from the previous question:

a

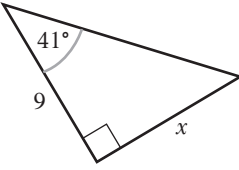

$$\cos \theta = \frac{A}{H}$$

$$\cos 58^\circ = \frac{14}{x}$$

$$x = \frac{14}{\cos 58^\circ}$$

$$x = 26.4 \text{ (1 d.p.)}$$

b

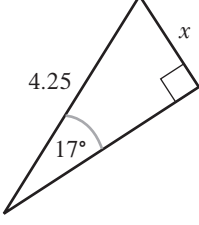

$$\tan \theta = \frac{O}{A}$$

$$\tan 41^\circ = \frac{x}{9}$$

$$x = 9 \tan 41^\circ$$

$$x = 7.8 \text{ (1 d.p.)}$$

c

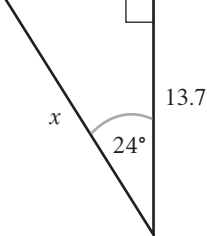

$$\sin \theta = \frac{O}{H}$$

$$\sin 17^\circ = \frac{x}{4.25}$$

$$x = 4.25 \sin 17^\circ$$

$$x = 1.2 \text{ (1 d.p.)}$$

d

$$\cos \theta = \frac{A}{H}$$

$$\cos 24^\circ = \frac{13.7}{x}$$

$$x = \frac{13.7}{\cos 24^\circ}$$

$$x = 15.0 \text{ (1 d.p.)}$$

4. A skier jumps a 4m ramp. 2m after the jump the skier's height is 12m. What is the angle of the ramp?

Note: 2 metres is added to 4 since the question states "2 metres after the ramp" therefore making the adjacent side 6 metres.

$$\tan \theta = \frac{O}{A}$$

$$\tan \theta = \frac{12}{6}$$

$$\theta = \tan^{-1}\left(\frac{12}{6}\right)$$

$$\theta = 63^\circ \text{ (nearest degree)}$$

Page 17 questions

5. A fisherman casts his line out and keeps his fishing rod pointing straight upwards. If the line touches the water 30 m from the shore at an angle of 30° , then how long is the fishing line to the nearest metre?

The length wanted is the hypotenuse.

$$\cos \theta = \frac{A}{H}$$

$$\cos 30^\circ = \frac{30}{H}$$

$$H = \frac{30}{\cos 30^\circ}$$

$$H = 34.6 \text{ m (1 d.p.)}$$

Therefore, the fishing line is 35 m.

6. If the fishing line is 40 m long and touches the water 33 m from the shore, at what angle will the line touch the water?

$$\cos \theta = \frac{A}{H}$$

$$\cos \theta = \frac{33}{40}$$

$$\theta = \cos^{-1}\left(\frac{33}{40}\right)$$

$$\theta = 34^\circ \text{ (nearest degree)}$$

Page 20 questions

1. A studio is 73 m to the left of a school. The angle of elevation from the base of the studio to the roof of the school is 44° . The angle of depression from the roof of the studio to the roof of the school is 79° .

a Find the height of the school to 3 decimal places.

$$\tan \theta = \frac{O}{A}$$

$$\tan 44^\circ = \frac{s}{73}$$

$$s = 73 \times \tan 44^\circ$$

$$s = 70.495\text{m (3 d.p.)}$$

b How much higher is the studio than the school to 3 decimal places?

$$\tan \theta = \frac{O}{A}$$

$$\tan 79^\circ = \frac{h}{73}$$

$$h = 73 \times \tan 79^\circ$$

$$h = 375.552\text{m (3 d.p.)}$$

c What is the total height of the studio to 1 decimal place?

$$b = s + h$$

$$b = 70.459 + 375.552$$

$$b = 446.0\text{m (1 d.p.)}$$

Page 21 questions

2. A skateboarder reads a sign on top of a 40 m building.

- a Identify the angle of elevation and the angle of depression in the following diagram:

- b If he sees the sign when he is 80 m away from the building, what is the angle of elevation from the skater to the sign?

$$\tan \theta = \frac{O}{A}$$

$$\tan \theta = \frac{40}{80}$$

$$\theta = \tan^{-1}\left(\frac{40}{80}\right)$$

$$\theta = 26.6^\circ \text{ (1 d.p.)}$$

- c If the skater continues skating until he is 30 m from the building, will the angle of elevation increase or decrease? By how much?

$$\tan \theta = \frac{O}{A}$$

$$\tan \theta = \frac{40}{30}$$

$$\theta = \tan^{-1}\left(\frac{40}{30}\right)$$

$$\theta = 53.1^\circ \text{ (1 d.p.)}$$

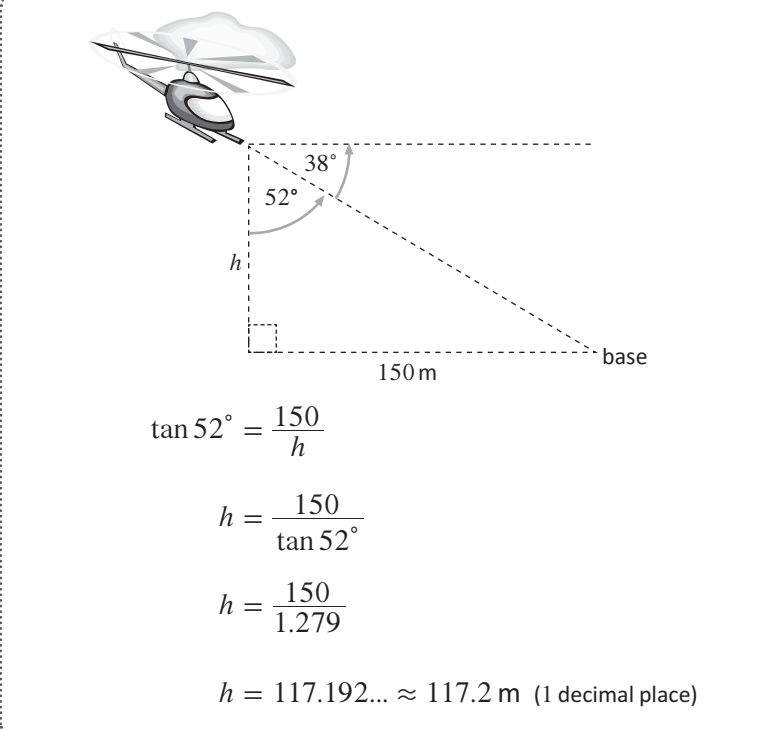

The angle of elevation will increase. It will increase by 26.5° .

Page 22 questions

3. Aiden answered the following question incorrectly. Can you spot his mistake?

The angle of depression from a helicopter to its landing base is 52° . If the horizontal distance between the helicopter and the landing base is 150 m, then how high is the helicopter (1 decimal place) at this point?

AIDEN'S SOLUTION

The diagram shows a helicopter at height h and a landing base 150 m away. A horizontal dashed line is drawn from the helicopter to the base. The angle of depression from the helicopter to the base is labeled as 52° . The angle between the horizontal dashed line and the hypotenuse is labeled as 38° .

$$\tan 52^\circ = \frac{150}{h}$$

$$h = \frac{150}{\tan 52^\circ}$$

$$h = \frac{150}{1.279}$$

$$h = 117.192... \approx 117.2 \text{ m (1 decimal place)}$$

a What was Aiden's mistake?

Aiden incorrectly labelled the angle of depression. The angle of depression is formed between the upper horizontal and hypotenuse not h and the hypotenuse.

b Find the correct height of the helicopter at this point.

If the angle of depression is 52° then the angle between the hypotenuse and h is $90^\circ - 52^\circ$ which is 38° .

$$\tan \theta = \frac{O}{A}$$

$$\tan 38^\circ = \frac{150}{h}$$

$$h = \frac{150}{\tan 38^\circ}$$

$$h = 192.0 \text{ m (1 d.p.)}$$

Page 23 questions

4. An aeroplane takes off at an angle of 28° to the ground. It flies over a house 900 m from the airport.

- a How high is the aeroplane at that point, to 3 decimal places?

$$\tan \theta = \frac{O}{A}$$

$$\tan 28^\circ = \frac{h}{900}$$

$$h = 900 \times \tan 28^\circ$$

$$h = 478.538 \text{ m (3 d.p.)}$$

- b What is the angle of depression at this point?

The angle of depression is 28° .

- c After continuing to fly at the same height, the pilot notices that as they are flying over a lake, the airport has a 15° angle of depression. How far is the lake away from the airport, to 2 decimal places?

$$\tan \theta = \frac{O}{A}$$

$$\tan 15^\circ = \frac{478.538}{x}$$

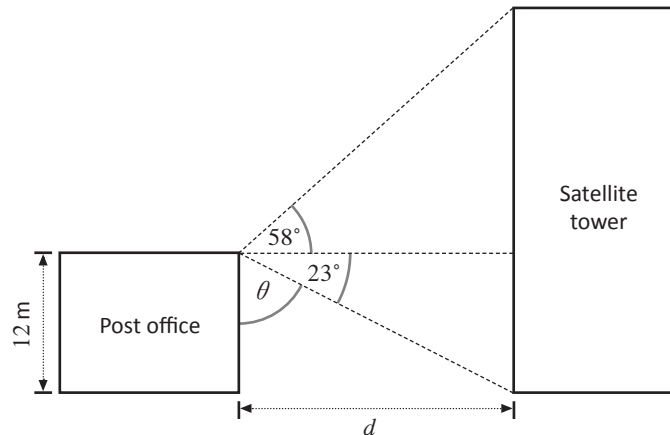

$$x = \frac{478.538}{\tan 15^\circ}$$

$$x = 1785.93 \text{ m (2 d.p.)}$$

Page 24 questions

5. A satellite tower is on the right of a post office and they are separated by a distance, d . The post office has a height of 12 m. The angle of depression from the roof of the post office to the base of the tower is 23° . The angle of elevation from the roof of the post office to the roof of the tower is 58° .

- a Draw a diagram to represent this situation.

- b Find d , the distance between the buildings to 1 decimal place:

Find θ ,

$$\theta = 90^\circ - 23^\circ$$

$$\theta = 67^\circ$$

$$\tan \theta = \frac{O}{A}$$

$$\tan 67^\circ = \frac{d}{12}$$

$$d = 12 \times \tan 67^\circ$$

$$d = 28.3 \text{ m (1 d.p.)}$$

- c Find the total height of the tower to 1 decimal place:

$$\tan \theta = \frac{O}{A}$$

$$\tan 58^\circ = \frac{O}{28.3}$$

$$h = 28.3 \times \tan 58^\circ$$

$$h = 45.3 \text{ m (1 d.p.)}$$

Therefore, the total of height is equal to $45.3 \text{ m} + 12 \text{ m} = 57.3 \text{ m}$

Page 27 questions

1. You and your friend stand in a building with 50 floors; each floor is 2 m high. You are on the 34th floor and your friend is on the top floor. Find the difference between your angles of elevation 60 m away.

Find θ ,

To find the opposite: $2 \times 50 = 100$ m since each floor is 2 m and here are 50 floors.

$$\begin{aligned} \tan \theta &= \frac{O}{A} \\ \tan \theta &= \frac{100}{60} \\ \theta &= \tan^{-1}\left(\frac{100}{60}\right) \\ \theta &= 59^\circ \end{aligned}$$

To find the opposite: $2 \times 34 = 68$ m since each floor is 2 m and here are 34 floors.

$$\begin{aligned} \tan \alpha &= \frac{68}{60} \\ \tan \alpha &= \tan^{-1} \frac{68}{60} \\ \alpha &= 48.6^\circ \end{aligned}$$

The difference is:

$$\begin{aligned} \theta - \alpha &= 59^\circ - 48.6^\circ \\ &= 10.4^\circ \end{aligned}$$

2. As a technician you need to tie rope along the dotted line in this rectangle.

a How many right angled triangles are involved in this problem?

There are 3 right angled triangles. However, it is only necessary to use one right angled triangle with the information given, to find all necessary lengths.

Page 27 questions

- b Find the total length of rope needed if all measurements are in m (nearest m):

$$\sin \theta = \frac{O}{H}$$

$$\sin 35^\circ = \frac{10}{H}$$

$$H = \frac{10}{\sin 35^\circ}$$

$$H = 17.4 \text{ m (1 d.p.)}$$

$$\tan \theta = \frac{O}{A}$$

$$\tan 35^\circ = \frac{10}{A}$$

$$A = \frac{10}{\tan 35^\circ}$$

$$A = 14.3 \text{ m (1 d.p.)}$$

Therefore the total length of rope needed is $17.4 \text{ m} + 14.3 \text{ m} = 31.7 \text{ m}$ which rounds to 32 m

Page 28 questions

3. In order to for a certain kite to fly it needs to look like this. Find the length of AB and angle $\angle ABE$ each to 1 decimal place.

$$\sin \theta = \frac{O}{H}$$

$$\sin 50^\circ = \frac{AE}{12}$$

$$AE = 12 \times \sin 50^\circ$$

$$AE = 9.19 \text{ m (2 d.p.)}$$

Using Pythagoras,

$$AB^2 = AE^2 + EB^2$$

$$AB^2 = 9.19^2 + 14^2$$

$$AB^2 = 280.46 \text{ (2 d.p.)}$$

$$AB = \sqrt{280.46}$$

$$AB = 16.7 \text{ m (1 d.p.)}$$

$$\tan \angle B = \frac{9.19}{14}$$

$$\angle ABE = \tan^{-1}(0.6564)$$

$$\angle ABE = 33.3^\circ \text{ (1 d.p.)}$$
