## ELECTRICITY - TEST YOURSELF 2

## Question One

The circuit diagram shows a component " $B$ " in series with a lamp. The potential difference (voltage) across the power supply is 6 V . The current flowing through the ammeter is 3 A . The voltage across the bulb is 3 V .

1. What current is flowing through $B$ ?
2. What is the voltage across $B$ ?
3. What is the power of the bulb?

Question Two.
The voltage of the battery is 4 V . Which arrangements of resistors could be placed in the dotted box, so that a current of 0.5 A flows in the circuit?

1. a $2 \Omega$ and a $4 \Omega$ resistor in series
2. a $5 \Omega$ and a $3 \Omega$ resistor in series
3. A $1 \Omega$ and a $7 \Omega$ resistor in parallel

## Question 3

The diagram shows a circuit with four resistors and four ammeters. The current flowing through A1 is 1.6A. The current flowing through A2 is $0.4 A$.

1. What could ammeters A3 and A4 read? Tick the correct answer(s).
a. $\quad 0.4 \mathrm{~A} \& 0.4 \mathrm{~A}$
b. $\quad 0.8 \mathrm{~A} \& 0.4 \mathrm{~A}$
c. $\quad 0.8 \mathrm{~A} \& 1.6 \mathrm{~A}$
d. $\quad 0.8 \mathrm{~A} \& 0.8 \mathrm{~A}$

2. Which resistors have the same voltage are the same voltage across them? Tick the correct answer(s).
a. $\quad \mathrm{R} 1 \& R 4$
b. $\quad \mathrm{R} 1 \& \mathrm{R} 3$
c. $\quad$ R2 \& R4
d. $\quad R 2$ \& R 3
e. All 4 resistors

## ANSWERS

## Question One

1. 3 A (current is the same all around a series circuit).
2. 3 V (supply voltage $=6 \mathrm{~V}$, voltage across bulb is 3 V so voltage across B must be $6-3=3 \mathrm{~V}$ )
3. $P=V . I P=3 \times 3=9 \mathrm{~W}$

## Question Two

Since $V=4 V$ and $I=0.5 \mathrm{~A}$, calculate $\mathrm{R} . \mathrm{R}=\mathrm{V} / \mathrm{I} \mathrm{R}=4 / 0.5=8 \Omega$. So the combination of resistors in the dotted box must equal $8 \Omega$.

1. a $2 \Omega$ and a $4 \Omega$ resistor in series $\times 2 \Omega+4 \Omega=6 \Omega$
2. a $5 \Omega$ and a $3 \Omega$ resistor in series $\checkmark 5 \Omega+3 \Omega=8 \Omega$
3. A $1 \Omega$ and a $7 \Omega$ resistor in parallel $x$ in parallel the total resistance of resistors in parallel is less than the resistance of the smallest one, ie smaller than $1 \Omega$. Don't ADD resistors in parallel together - this is only true for resistors in series.

## Question Three

1. The sum of the currents in the parallel part of the circuit equals the current before the current splits, so $\mathrm{A} 1(1.6)=\mathrm{A} 2(0.4)+\mathrm{A} 3+\mathrm{A} 4$.

So $\mathrm{A} 3+\mathrm{a} 4$ must equal 1.2 A
a. $\quad 0.4 \mathrm{~A} \& 0.4 \mathrm{~A} \times$ These add up to 0.8 A
b. $\quad 0.8 \mathrm{~A} \& 0.4 \mathrm{~A} \checkmark 0.8+0.4=1.2 \mathrm{~A}$
c. $0.8 \mathrm{~A} \& 1.6 \mathrm{~A} \times$ They don't add up to 1.2 A
d. $0.8 \mathrm{~A} \& 0.8 \mathrm{~A} \times$ They don't add up to 1.2 A
2. The voltages are equal across R2, R3 and R4 as they are in parallel strands of the circuit.
a. R1 \& R4 $\times$
b. R1 \& R3 $x$
c. $\quad$ R $2 \& R 4 \checkmark$ They are in parallel
d. $\quad$ R2 \& R3 $\checkmark$ They are in parallel
e. All 4 resistors $\times$
