

Do now on writing expressions

WALT Dividing algebraic terms

Success Criteria

When dividing algebraic terms containing pronumerals and numbers, follow these steps.

Step 1: Write the division as a fraction.

Step 2: Cancel the numbers, if possible.

Step 3: Cancel the pronumerals, if possible.

Step 4: Write your answer as a fraction.

(Remember: Cancel means divide the numerator and denominator by the same number or pronumeral.)

Step 4: Write your answer as a fraction.

[Video On dividing algebraic terms](#)

1 Complete the following to simplify.

$$\begin{aligned} \mathbf{a} \quad 10y \div 15 &= \frac{10y}{\square} \\ &= \frac{2y}{\square} \end{aligned}$$

$$\begin{aligned} \mathbf{b} \quad 8m \div 12m &= \frac{\square}{12m} \\ &= \frac{\square}{3} \end{aligned}$$

$$\begin{aligned} \mathbf{c} \quad 6x \div 8xy &= \frac{\square}{8xy} \\ &= \frac{\square}{4y} \end{aligned}$$

2 Simplify the following.

$$\mathbf{a} \quad 9x \div 18$$

$$\mathbf{b} \quad 3m \div 12$$

$$\mathbf{c} \quad 5p \div 25$$

$$\mathbf{d} \quad 16d \div 4$$

$$\mathbf{e} \quad \frac{10c}{2}$$

$$\mathbf{f} \quad \frac{8a}{4}$$

$$\mathbf{g} \quad \frac{6a}{12a}$$

$$\mathbf{h} \quad \frac{44m}{22m}$$

$$\mathbf{i} \quad \frac{12a}{15a}$$

$$\mathbf{j} \quad \frac{20d}{10d}$$

$$\mathbf{k} \quad \frac{3f}{9f}$$

$$\mathbf{l} \quad \frac{4t}{20t}$$

$$\mathbf{m} \quad \frac{18p}{20d}$$

$$\mathbf{n} \quad \frac{6xy}{15x}$$

$$\mathbf{o} \quad \frac{24ab}{36bc}$$

$$\mathbf{p} \quad \frac{16r}{20qr}$$

$$\mathbf{q} \quad \frac{8yz}{40xyz}$$

$$\mathbf{r} \quad \frac{70dkl}{10klm}$$

$$\mathbf{s} \quad \frac{15pqr}{12q}$$

$$\mathbf{t} \quad \frac{14mn}{35mp}$$

Challenge

EXAMPLE 2

Simplify the following.

$$\mathbf{a} \quad \frac{-xy}{-y}$$

$$\mathbf{b} \quad \frac{40ac}{-10ac}$$

$$\mathbf{c} \quad \frac{-16x^2y}{-8x}$$

Remember: When dividing two integers:
If the signs are the same, the result is positive. 
If the signs are different, the result is negative.

$$\begin{aligned} \mathbf{a} \quad \frac{-xy}{-y} &= \frac{\cancel{-}xy}{\cancel{-}y} \\ &= x \end{aligned}$$

$$\begin{aligned} \mathbf{b} \quad \frac{40ac}{-10ac} &= \frac{\cancel{4}0ac}{\cancel{-}10ac} \\ &= -4 \end{aligned}$$

$$\begin{aligned} \mathbf{c} \quad \frac{-16x^2y}{-8x} &= \frac{\cancel{-}216x^2y}{\cancel{-}8x} \\ &= 2xy \end{aligned}$$

3 Complete the following to simplify.

$$\begin{aligned} \text{a } \frac{15ab}{-20ac} &= \frac{15ab}{\square} \\ &= \frac{3b}{\square} \\ &= -\frac{3b}{\square} \end{aligned}$$

$$\begin{aligned} \text{b } \frac{-x}{xy} &= \frac{\square}{xy} \\ &= \frac{\square}{y} \\ &= -\frac{\square}{y} \end{aligned}$$

4 Simplify the following.

$$\text{a } \frac{-50d}{10d}$$

$$\text{b } \frac{-12fg}{-18g}$$

$$\text{c } \frac{-6kl}{9l}$$

$$\text{d } \frac{12fg}{-3gh}$$

$$\text{e } \frac{-36lm}{9m}$$

$$\text{f } \frac{-90y}{99x}$$

$$\text{g } \frac{-45c}{-15ac}$$

$$\text{h } \frac{-a^2bc}{b^2c}$$

$$\text{i } \frac{-mn}{n^2}$$

$$\text{j } \frac{x^2yz^2}{-y^2x}$$

$$\text{k } -64p \div -16q$$

$$\text{l } -6ac \div -9c$$

$$\text{m } -2mn \div -8mn$$

$$\text{n } -10 \div 5mn$$

$$\text{o } -3q \div q$$

$$\text{p } 21pq \div -3p^2$$

Extension

Simplify the following divisions by cancelling any common factors.

$$\text{a } \frac{5a}{10a}$$

$$\text{b } \frac{7x}{14y}$$

$$\text{c } \frac{10xy}{12y}$$

$$\text{d } \frac{ab}{4b}$$

$$\text{e } \frac{7xyz}{21yz}$$

$$\text{f } \frac{2}{12x}$$

$$\text{g } \frac{4xy}{7x}$$

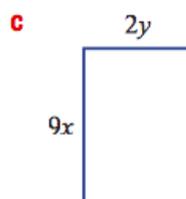

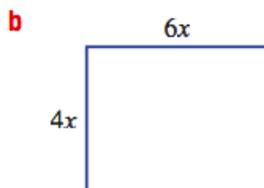

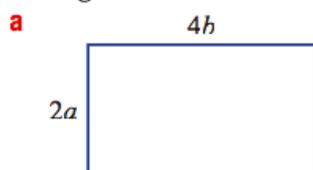

$$\text{h } \frac{3abc}{6b}$$

Cancel numbers and pronumerals where possible

Problem-solving and Reasoning

Write a simplified expression for the area of the following shapes. Recall that rectangle area = width \times length.

Simplify the following completely.

$$\text{a } 2a \times 3b + 5ab$$

$$\text{b } 6q \times 2r + 4q \times 3r$$

$$\text{c } 10x \times 2y - 3y \times 6x$$

You can combine any like terms.

Fill in the missing terms to make the following equivalences true.

$$\text{a } 3x \times \square \times z = 6xyz$$

$$\text{b } 4a \times \square = 12ab$$

$$\text{c } \frac{\square}{4r} = 7s$$

$$\text{d } \frac{\square}{2ab} = 4b$$

Joanne claims that the following three expressions are equivalent: $\frac{2a}{5}$, $\frac{2}{5} \times a$, $\frac{2}{5a}$.

a Is she right? Try different values of a .

b Which two expressions are equivalent?

c There are two values of a that make all three expressions are equal. State one of them.

Check if you can work on it

- a** Simplify $2a \times 3b + 5b \times 2a$ to a single term.
- b** State another way to fill in the blanks to make the simplification correct:
 $\square a \times \square b + \square b \times \square a = 16ab$
- c** Give an example of an even longer expression that is equivalent to $16ab$.

Check your answers

1 a $\frac{{}^2 10y}{{}^3 15} = \frac{2y}{3}$ c $\frac{{}^2 8^1 m}{{}^3 12^1 m} = \frac{2}{3}$ e $\frac{{}^3 6^1 x}{{}^4 8^1 xy} = \frac{3}{4y}$

2 a $\frac{x}{2}$ b $\frac{m}{4}$ c $\frac{p}{5}$ d $4d$ e $5c$
 f $2a$ g $\frac{1}{2}$ h 2 i $\frac{4}{5}$ j 2
 k $\frac{1}{3}$ l $\frac{1}{5}$ m $\frac{9p}{10d}$ n $\frac{2y}{5}$ o $\frac{2a}{3c}$
 p $\frac{4}{5q}$ q $\frac{1}{5x}$ r $\frac{7d}{m}$ s $\frac{5pr}{4}$ t $\frac{2n}{5p}$

3 a $\frac{{}^3 15^1 ab}{{}^{-4} 20^1 ac} = -\frac{3b}{4c}$ b $\frac{{}^{-1} x}{{}^1 xy} = -\frac{1}{y}$

4 a -5 b $\frac{2f}{3}$ c $-\frac{2k}{3}$ d $-\frac{4f}{h}$
 e $-4l$ f $-\frac{10y}{11x}$ g $\frac{3}{a}$ h $-\frac{a^2}{b}$
 i $-\frac{m}{n}$ j $-\frac{xz^2}{y}$ k $\frac{4p}{q}$ l $\frac{2a}{3}$
 m $\frac{1}{4}$ n $-\frac{2}{mn}$ o -3 p $-\frac{7q}{p}$
