## WALT expand quadratic expansion

Success criteria I know when multiplying two pairs of brackets I use distributive law.

A quadratic expansion is one where terms in two pairs of brackets are multiplied together.

> Example
> Expand $(x+2)(x+3)$

Answer
If we consider the first brackets $(x+2)$ to be a single expression, it multiplies each of the terms in the second brackets.
$(x+2)(x+3)=(x+2) x+(x+2) 3$
Then expand brackets in the usual way:

$$
\begin{aligned}
& =x^{2}+2 x+3 x+6 \\
& =x^{2}+5 x+6
\end{aligned}
$$

Note: it is not necessary to show as much working as presented in the above example.
In quadratic expansions each term in the first set of brackets multiplies each term in the second set. This gives four terms. Finally, simplify by adding like terms.
Expand $(x-4)(x+7)$.
Expand $(x-4)(x+7)$.
Answer
Answer
$x \times x \rightarrow x^{2}$
$x \times x \rightarrow x^{2}$
$x \times 7 \rightarrow 7 x$
$x \times 7 \rightarrow 7 x$
$-4 \times x \rightarrow-4 x$
$-4 \times x \rightarrow-4 x$
$-4 \times 7 \rightarrow-28$
$-4 \times 7 \rightarrow-28$
$\begin{aligned}(x-4)(x+7) & =x^{2}+7 x-4 x-28 \\ & =x^{2}+3 x-28\end{aligned}$
$\begin{aligned}(x-4)(x+7) & =x^{2}+7 x-4 x-28 \\ & =x^{2}+3 x-28\end{aligned}$

Expand and simplify these quadratic expressions.

| 1 | $(x+2)(x+6)$ | 6 | $(x-6)(x-3)$ | $11(x-9)(x-8)$ | $16(x-7)(x+12)$ |

## Follow the examples

The examples in Exercise 8.02 are all very similar. Each bracket begins with a single $x$.
Other types are more challenging!

```
- Example
Expand and simplify:
a \((2 x+5)(3 x-2)\)
b \((4-x)(7-3 x)\)
Answer
a \((2 x+5)(3 x-2)=6 x^{2}-4 x+15 x-10\)
\(=6 x^{2}+11 x-10\)
b \((4-x)(7-3 x)=28-12 x-7 x+3 x^{2}\)
    \(=28-19 x+3 x^{2}\) or \(3 x^{2}-19 x+28\)
```

## 回 Squaring brackets

When the expressions in the brackets are identical the bracket is being multiplied by itself, and is therefore being squared.

Examples
$(x-3)(x-3)$ can be written as $(x-3)^{2}$.
$(2 x+1)^{2}$ written in full is $(2 x+1)(2 x+1)$.
$35(2 x-y)(2 x+y)$
$36(5 x+3 y)(5 x-3 y)$
37 Explain why $2 x+3(x-2)$ and $(2 x+3)(x-2)$ do not give the same answer when expanded.
38-42 Expand and simplify each expression in the table.

| 38 | a | $5+x(x+3)$ | b | $(5+x)(x+3)$ |
| :--- | :--- | :--- | :--- | :--- |
| 39 | a | $(x+3)(2 x-4)$ | b | $x+3(2 x-4)$ |
| 40 | a | $(x+2)(x-8)$ | b | $(x+2) x-8$ |
| 41 | a | $1+x(x-1)$ | b | $(1+x)(x-1)$ |
| 42 | a | $(2 x-3)(x+4)$ | b | $2 x-3(x+4)$ |

## Example

- Answer

\begin{aligned}
(x+8)^{2} & =(x+8)(x+8) \\
& =x^{2}+8 x+8 x+64 \\

\end{aligned}
$$
