

## Do now

Expand and simplify:

|          |              |          |              |          |              |          |              |
|----------|--------------|----------|--------------|----------|--------------|----------|--------------|
| <b>a</b> | $(x + 1)^2$  | <b>b</b> | $(x + 3)^2$  | <b>c</b> | $(x - 2)^2$  | <b>d</b> | $(x - 5)^2$  |
| <b>e</b> | $(2 + x)^2$  | <b>f</b> | $(2 - x)^2$  | <b>g</b> | $(2x + 1)^2$ | <b>h</b> | $(2x - 1)^2$ |
| <b>i</b> | $(3x + 2)^2$ | <b>j</b> | $(3x - 2)^2$ | <b>k</b> | $(x + y)^2$  | <b>l</b> | $(x - y)^2$  |

Expand and simplify:

|          |                    |          |                  |          |                    |
|----------|--------------------|----------|------------------|----------|--------------------|
| <b>a</b> | $(x - 1)(x + 1)$   | <b>b</b> | $(x + 4)(x - 4)$ | <b>c</b> | $(x + 5)(x - 5)$   |
| <b>d</b> | $(2x + 1)(2x - 1)$ | <b>e</b> | $(4 - x)(4 + x)$ | <b>f</b> | $(3 - 2x)(3 + 2x)$ |

Why did the  $x$ -terms disappear in the expansions of question 6?

## WALT: Factorise algebraic expressions

**Success Criteria:** I know in expansions we have to remove brackets whereas in factorisation we have to insert brackets

### [Video Dr Frost](#)

**1** Copy and complete:

|          |                             |          |                              |
|----------|-----------------------------|----------|------------------------------|
| <b>a</b> | $3x + 6 = 3(x + \dots)$     | <b>b</b> | $4a - 12 = 4(a - \dots)$     |
| <b>c</b> | $20 - 5p = 5(\dots - p)$    | <b>d</b> | $16x + 12 = 4(\dots + 3)$    |
| <b>e</b> | $3x^2 - 9x = 3x(x - \dots)$ | <b>f</b> | $2m + 8m^2 = 2m(\dots + 4m)$ |

**2** Copy and complete:

|          |                              |          |                              |
|----------|------------------------------|----------|------------------------------|
| <b>a</b> | $4x + 12 = 4(\dots + \dots)$ | <b>b</b> | $9 + 3d = 3(\dots + \dots)$  |
| <b>c</b> | $3c - 3 = 3(\dots - \dots)$  | <b>d</b> | $cd + de = d(\dots \dots)$   |
| <b>e</b> | $6a + 8ab = \dots(3 + 4b)$   | <b>f</b> | $4x - 2x^2 = \dots(2 - x)$   |
| <b>g</b> | $4ab - 4a = \dots(b - 1)$    | <b>h</b> | $4ab - 6bc = \dots(2a - 3c)$ |

**3** Fully factorise:

|          |            |          |            |          |               |
|----------|------------|----------|------------|----------|---------------|
| <b>a</b> | $5a + 5b$  | <b>b</b> | $2x - 4$   | <b>c</b> | $7d + 14$     |
| <b>d</b> | $21 - 14x$ | <b>e</b> | $6x - 12$  | <b>f</b> | $12 + 3x$     |
| <b>g</b> | $ac + bc$  | <b>h</b> | $12y - 6a$ | <b>i</b> | $2a + ab$     |
| <b>j</b> | $bc - 3cd$ | <b>k</b> | $2x - xy$  | <b>l</b> | $xy + y$      |
| <b>m</b> | $a + ab$   | <b>n</b> | $ab - bc$  | <b>o</b> | $2an + ab$    |
| <b>p</b> | $ab - a$   | <b>q</b> | $ab + bc$  | <b>r</b> | $2x + xy - 4$ |

Remember to check your factorisations by expanding back out!

## Factorising Quadratics - Challenge

### Example 17

Factorise:  $x^2 + 11x + 24$

We need to find two numbers which have sum = 11, product = 24.  
Pairs of factors of 24:

|                       |               |               |              |              |
|-----------------------|---------------|---------------|--------------|--------------|
| <i>Factor product</i> | $1 \times 24$ | $2 \times 12$ | $3 \times 8$ | $4 \times 6$ |
| <i>Factor sum</i>     | 25            | 14            | 11           | 10           |

↑  
this one

The numbers we want are 3 and 8.

$$\begin{aligned}\text{So, } x^2 + 11x + 24 \\ = (x + 3)(x + 8)\end{aligned}$$

Most of the time we can find these two numbers mentally.

**Note:** Only the last two lines of this example need to be shown in your working.

**2** Factorise:

**a**  $x^2 + 4x + 3$

**b**  $x^2 + 11x + 24$

**c**  $x^2 + 10x + 21$

**d**  $x^2 + 15x + 54$

**e**  $x^2 + 9x + 20$

**f**  $x^2 + 8x + 15$

**g**  $x^2 + 10x + 24$

**h**  $x^2 + 9x + 14$

**i**  $x^2 + 6x + 8$

**j**  $x^2 + 11x + 18$

**k**  $x^2 + 9x + 18$

**l**  $x^2 + 13x + 42$

**m**  $x^2 + 11x + 24$

**n**  $x^2 + 15x + 26$

**o**  $x^2 + 29x + 100$

**Example 15**Fully factorise:  $-2a + 6ab$ 

$$\begin{aligned}
 & -2a + 6ab \\
 & = 6ab - 2a && \{\text{Rewrite with } 6ab \text{ first. Why?}\} \\
 & = 2 \times 3 \times a \times b - 2 \times a \\
 & = 2a(3b - 1) && \{\text{as } 2a \text{ is the HCF}\}
 \end{aligned}$$

**5** Fully factorise:

**a**  $-2a + 2b$

**b**  $-3 + 6b$

**c**  $-4a + 8b$

**d**  $-3c + cd$

**e**  $-a + ab$

**f**  $-7x^2 + 14x$

**g**  $-6x + 12x^2$

**h**  $-4b^2 + 2ab$

**i**  $-a + a^2$

**Example 16**Fully factorise:  $-2x^2 - 4x$ 

$$\begin{aligned}
 & -2x^2 - 4x \\
 & = -2 \times x \times x + -2 \times 2 \times x \\
 & = -2x(x + 2) && \{\text{as HCF is } -2x\}
 \end{aligned}$$

**6** Fully factorise:

**a**  $-3a - 3b$

**b**  $-4 - 8x$

**c**  $-3y - 6b$

**d**  $-5c - cd$

**e**  $-x - xy$

**f**  $-5x^2 - 10x$

**g**  $-4y - 12y^2$

**h**  $-6a^2 - 3ab$

**i**  $-8x^2 - 24x$

**Example 18**Factorise:  $x^2 - 7x + 12$ sum =  $-7$  and product =  $12$  $\therefore$  numbers are  $-3$  and  $-4$ 

$$\begin{aligned} \text{So, } x^2 - 7x + 12 \\ = (x - 3)(x - 4) \end{aligned}$$

As the sum is negative but the product is positive, both numbers must be negative.

**3** Factorise:

**a**  $x^2 - 3x + 2$

**b**  $x^2 - 4x + 3$

**c**  $x^2 - 5x + 6$

**d**  $x^2 - 14x + 33$

**e**  $x^2 - 16x + 39$

**f**  $x^2 - 19x + 48$

**g**  $x^2 - 11x + 28$

**h**  $x^2 - 14x + 24$

**i**  $x^2 - 20x + 36$

**j**  $x^2 - 7x + 12$

**k**  $x^2 - 17x + 30$

**l**  $x^2 - 11x + 30$

**m**  $x^2 - 13x + 36$

**n**  $x^2 - 13x + 42$

**o**  $x^2 - 17x + 60$

**Example 19**Factorise: **a**  $x^2 - 2x - 15$     **b**  $x^2 + x - 6$ **a** sum =  $-2$  and product =  $-15$  $\therefore$  numbers are  $-5$  and  $3$ 

$$\begin{aligned} \text{So, } x^2 - 2x - 15 \\ = (x - 5)(x + 3) \end{aligned}$$

**b** sum =  $1$  and product =  $-6$  $\therefore$  numbers are  $3$  and  $-2$ 

$$\begin{aligned} \text{So, } x^2 + x - 6 \\ = (x + 3)(x - 2) \end{aligned}$$

Notice that as the product is negative, the numbers are opposite in sign.

**4** Factorise:

**a**  $x^2 - 7x - 8$

**b**  $x^2 + 4x - 21$

**c**  $x^2 - x - 2$

**d**  $x^2 - 2x - 8$

**e**  $x^2 + 5x - 24$

**f**  $x^2 - 3x - 10$

**g**  $x^2 + 3x - 54$

**h**  $x^2 + x - 72$

**i**  $x^2 - 4x - 21$

**j**  $x^2 - x - 6$

**k**  $x^2 - 7x - 60$

**l**  $x^2 + 7x - 60$

### Example 20

Fully factorise by first removing a common factor:  $3x^2 + 6x - 72$

$$\begin{aligned}
& 3x^2 + 6x - 72 \quad \{\text{first look for a common factor}\} \\
& = 3(x^2 + 2x - 24) \quad \{\text{sum} = 2, \text{ product} = -24 \text{ i.e., } 6 \text{ and } -4\} \\
& = 3(x + 6)(x - 4)
\end{aligned}$$

5 Fully factorise by first removing a common factor:

- |                             |                             |                             |
|-----------------------------|-----------------------------|-----------------------------|
| <b>a</b> $2x^2 + 10x + 8$   | <b>b</b> $3x^2 - 21x + 18$  | <b>c</b> $2x^2 + 14x + 24$  |
| <b>d</b> $2x^2 - 44x + 240$ | <b>e</b> $4x^2 - 8x - 12$   | <b>f</b> $3x^2 - 42x + 99$  |
| <b>g</b> $2x^2 - 2x - 180$  | <b>h</b> $3x^2 - 6x - 24$   | <b>i</b> $2x^2 + 18x + 40$  |
| <b>j</b> $x^3 - 7x^2 - 8x$  | <b>k</b> $x^3 - 3x^2 - 28x$ | <b>l</b> $x^4 + 2x^3 + x^2$ |

“the difference of two squares”.

### Example 21

Fully factorise:

|                    |                      |
|--------------------|----------------------|
| <b>a</b> $x^2 - 4$ | <b>b</b> $1 - 25y^2$ |
| <b>a</b> $x^2 - 4$ | <b>b</b> $1 - 25y^2$ |
| $= x^2 - 2^2$      | $= 1^2 - (5y)^2$     |
| $= (x + 2)(x - 2)$ | $= (1 + 5y)(1 - 5y)$ |

Write each term as a square.

### EXERCISE 11E

1 Fully factorise:

- |                      |                        |                        |                         |
|----------------------|------------------------|------------------------|-------------------------|
| <b>a</b> $c^2 - d^2$ | <b>b</b> $m^2 - n^2$   | <b>c</b> $n^2 - m^2$   | <b>d</b> $m^2 - x^2$    |
| <b>e</b> $x^2 - 16$  | <b>f</b> $x^2 - 81$    | <b>g</b> $a^2 - 9$     | <b>h</b> $4x^2 - 1$     |
| <b>i</b> $4x^2 - 9$  | <b>j</b> $9y^2 - 25$   | <b>k</b> $64 - x^2$    | <b>l</b> $16 - 9a^2$    |
| <b>m</b> $9x^2 - 1$  | <b>n</b> $4a^2 - 9b^2$ | <b>o</b> $16a^2 - x^2$ | <b>p</b> $9x^2 - 16b^2$ |

# F

## PERFECT SQUARE FACTORISATION (EXTENSION)

Recall that

$$\begin{aligned}
& (a + b)^2 \\
& = (a + b)(a + b) \\
& = a^2 + ab + ab + b^2 \\
& = a^2 + 2ab + b^2
\end{aligned}$$

and

$$\begin{aligned}
& (a - b)^2 \\
& = (a - b)(a - b) \\
& = a^2 - ab - ab + b^2 \\
& = a^2 - 2ab + b^2
\end{aligned}$$
