

**Prerequisites:** All angle laws: angles in a triangle, on a straight line, around a point, isosceles triangles and alternate, corresponding, cointerior and vertically opposite angles.

**Key Point:** Sometimes angles may be **algebraic expressions**. Just **use angle laws in the usual way**.

For example, if given angles in a triangle, add them together and set the sum to  $180^\circ$ , or equate angles you know are equal.

### Worked Example 1: Determine $x$ .

Corresponding angles are equal. So equate the two expressions.

$$\begin{aligned} 2x - 10 &= x + 30 \\ x - 10 &= 30 && (-x) \\ x &= 40^\circ && (+10) \end{aligned}$$

Collect  $x$ 's on side with more  $x$ 's, in this case the left-hand-side. Subtract  $x$  from both sides to get rid of  $x$  on RHS.

To get  $x$  on it's own, we need to get rid of  $-10$ . So  $+10$  to both sides to get rid of it.

### Worked Example 2: Determine $x$ .

$$\begin{aligned} x + 3x - 5 + 4x + 25 &= 180 \\ 8x + 20 &= 180 \\ 8x &= 160 \\ x &= 20^\circ \end{aligned}$$

Angles in triangle sum to  $180^\circ$ . So add expressions and set to  $180^\circ$ .

Tidy up LHS by collecting like terms.

### Worked Example 3: Determine $y$ .

Base angles of isosceles triangle are equal.

$$\begin{aligned} 4x &= x + 60 \\ 3x &= 60 \\ x &= 20^\circ \end{aligned}$$

Determine  $x$ .

$$\begin{aligned} \text{Angles on left:} \\ 4 \times 20 &= 80^\circ \\ y &= 180 - 80 - 80 \\ &= 20^\circ \end{aligned}$$

Angles in triangle sum to  $180^\circ$ .

## Core Questions

### 1 Determine the value of $x$ .

### 2 Determine the value of $x$ .

### 3 Determine the value of $y$ .

## Problem Solving

### 4 Determine an expression for $y$ in terms of $x$ .

### 5 Determine an expression for $a$ in terms of $b$ and $c$ .

### 6 Determine the value of $x$ .

**Solutions:**  
 1(a)  $60^\circ$  (b)  $50^\circ$  (c)  $25^\circ$  (d)  $15^\circ$  (e)  $40^\circ$  (f)  $20^\circ$   
 2(a)  $30^\circ$  (b)  $30^\circ$  (c)  $35^\circ$  (d)  $36^\circ$  (e)  $12^\circ$  (f)  $15^\circ$   
 3(a)  $x = 30^\circ, y = 135^\circ$  (b)  $x = 31^\circ, y = 44^\circ$   
 4(a)  $y = 180 - 2x$  (b)  $y = 170 - 3x$  (c)  $y = 180 - 2x$   
 5.  $a = b + c$  6.  $x = 36^\circ$
